VELOCIDADES DE VIENTO MÁX. AUTORIZADOS

Descripción de las tablas "Viento autorizado con la grúa fuera de servicio"

A T E N C I Ó N: tLas tablas se han clasificado según la cantidad de mecanismos giratorios que se han instalado.

En las tablas se indican para cada combinación de pluma, la posición óptima con el ángulo de pluma y el radio de pluma.

Esta posición para este caso se determina con el freno de parada del mecanismo giratorio (dirección de viento a 360°) y se indica la velocidad de viento autorizado bajo VWAB.

Además se indica para el giro contra el viento lateral, la velocidad de viento con VWABF y con la misma posición. Tenga en cuenta igualmente que pueda retenerse la pluma basculante con el freno de parada del mecanismo giratorio o la pluma principal en el servicio de mástil principal, en posición (0°) con los frenos del mecanismo giratorio contra el viento lateral.

PELIGRO: Si se espera altas velocidades de viento, se deberá descender y depositar la grúa a

tiempo y cuando hay una velocidad de viento baja tal como está indicado en la ta-

bla en la columna VWRST.

Indicación: Los valores de viento son aquellos valores resentidos en la grúa durante más de 3 segundos,

lo cual determina la velocidad de ráfagas de viento. La altura en que se encuentra el manó-

 $metro\ \boldsymbol{superior}.$

Explicación sobre la tabla:

DWG Engranaje de mecanismo giratorio

HA Largo de pluma principal

HI Largo de pluma basculante

WHA Valor de ángulo: Pluma principal con relación a la línea horizontal,

ATENCIÓN: La posición angular puede encontrarse fuera de las tablas de cargas.

WHI Valor de ángulo: Pluma basculante (igualmente WV) con relación a la línea horizontal, con

una punta fija: Ángulo intermedio

ATENCIÓN: La posición angular puede encontrarse fuera de las tablas de cargas.

RAD Alcance del motón de gancho medido hasta el centro de la Unión giratoria sobre rodillos

HKFL Peso máx. de motón de gancho

OWB Lastre de plataforma giratoria

ZBL Lastre central

DB Lastre Derrick

DRAD Radio para el lastre Derrick

VWAB Velocidad de viento máx. autorizado a una dirección de viento de 360° y con frenos de meca-

nismo giratorio accionados.

VWABF Velocidad de viento máx. autorizado posible para el giro contra el viento lateral. Se debe te-

ner en cuenta que pueda retenerse la pluma basculante con el freno de parada del mecanismo giratorio o la pluma principal en el servicio de mástil principal, en posición pn (0°) con

los frenos del mecanismo giratorio contra el viento lateral.

VWRST Velocidad de viento autorizado para el descenso
